

DevMind — Frontend UI Reference Guide

A visual and functional blueprint for the focused document → AI explanation experience.

Core workflow: Upload a document → process it → open it → ask AI questions → receive a grounded explanation with sources.

1. Product Direction

DevMind should feel like a clean developer workspace, not a large learning-management dashboard. The first version should make one job extremely obvious: bring your own technical material and use AI to understand it. Keep analytics, interviews, study plans, and other secondary features for later.

2. Main Documents Screen

Rule: Keep the sidebar small. Documents are the primary navigation item.

3. Upload Screen + Processing States

Always show clear processing states. A document should become AI-ready only after its text has been processed and embeddings are available.

4. Document + AI Workspace

Core UX: Left side = document context. Right side = AI tutor. The relationship between the selected document and AI conversation should always be obvious.

5. AI Answer + Sources

Source references are a key part of the product. Make them visually distinct and, ideally, clickable so the user can jump to the relevant document section.

6. Chat Input + Quick Actions

Quick actions should be shortcuts, not separate pages. The user can always type a custom question.

7. Select Text → Ask AI

A strong future interaction is allowing users to select text in the document and immediately ask AI to explain, summarize, or quiz them on that selection.

8. Visual Design

Purpose	Color
Background	#0B0F14
Sidebar	#0F141B
Cards	#151B23
Borders	#252D38
Primary text	#F8FAFC
Secondary text	#94A3B8
AI accent	#8B5CF6
Primary	#6366F1
Success	#22C55E

Use purple mainly for AI actions, active states, selected documents, and important actions. Avoid making the whole interface purple.

9. MVP Screens — Build These First

1. **Documents** — upload files, show processing state, list ready documents.
2. **Document Workspace** — document viewer on the left, AI panel on the right.
3. **AI Explanation** — questions, streamed answers, and source references.
4. **Upload/Processing** — clear states for extraction, chunking, and embedding.

Do not build first: analytics dashboards, interviews, study plans, complex topic management, or social features. Make the core document → AI workflow excellent first.

10. Product Flow

```
UPLOAD DOCUMENT
↓
PROCESS DOCUMENT
↓
DOCUMENT READY
↓
OPEN DOCUMENT
↓
ASK AI
↓
RAG RETRIEVAL
↓
LLM RESPONSE
↓
EXPLANATION + SOURCES
```

The frontend should make this flow feel simple even though the backend/RAG pipeline is technically sophisticated.
